Discuss in pairs or small groups for 15 minutes

- What writing have you done over the last month?
- What kind of quantitative data / analysis will you have in your thesis?
- How will you present this data / analysis?
- What challenges do you face in commenting on your data?
- What advice and / or resources have you found helpful in writing about your data / analysis?
Acknowledgements
This presentation refers to four Massey doctoral theses:

- **Rosemary Gibson (2014)** Understanding and Managing Dementia-Related Sleep Problems: Community-Based Research with Older New Zealanders. [http://hdl.handle.net/10179/6688](http://hdl.handle.net/10179/6688)

- **Lisanne Fermin (2017)** Pre-implantation maternal uterine effects on embryo growth and development: An investigation using models of maternal constraint in sheep. [http://hdl.handle.net/10179/4793](http://hdl.handle.net/10179/4793)

- **Hwee Ming Teo (2016)** Development of novel nanoemulsions as delivery systems. [http://hdl.handle.net/10179/9903](http://hdl.handle.net/10179/9903)

- **Nirosha Priyadarshani (2017)** Wavelet-based birdsong recognition for conservation. [http://hdl.handle.net/10179/12127](http://hdl.handle.net/10179/12127)

We also refer to this useful online resource:

phrasebank.manchester.ac.uk

The Academic Phrasebank is a general resource for academic writers. It aims to provide you with examples of some of the phraseological 'nuts and bolts' of writing organised according to the main sections of a research paper or dissertation (see the top menu). Other phrases are listed under the more general communicative functions of academic writing (see the menu on the left). The resource should be particularly useful for writers who need to report their research work. The phrases, and the headings under which they are listed, can be used simply to assist you in thinking about the content and organisation of your own writing, or the phrases can be incorporated into your writing where this is appropriate. In most cases, a certain amount of creativity and adaptation will be necessary when a phrase is used. The items in the Academic Phrasebank are mostly content neutral and generic in nature; in using them, therefore, you are not stealing other people's ideas and this does not constitute plagiarism. For some of the entries, specific content words have been included for illustrative purposes, and these should be substituted when the phrases are used.

The resource was designed primarily for academic and scientific writers who are non-native speakers of English. However, native speaker writers may still find much of the material helpful. In fact, recent data suggest that the majority of users are native speakers of English. More about Academic Phrasebank.

This site was created by John Morley. If you could spare just two or three minutes of your time, I would be extremely grateful for any feedback on Academic Phrasebank: Please click here to access a very short questionnaire. Thank you.
Reporting Results

Providing background information: reference to the literature

Providing background information: reference to the question

Restating the result or one of several results

Indicating an unexpected outcome

Comparing the result: supporting previous findings

Comparing the result: contradicting previous findings

Offering an explanation for the findings

Advising cautious interpretation of the findings

Suggesting general hypotheses

Noting implications of the findings

Commenting on the findings

Giving suggestions for future work

Stating a positive result - close

The mean score for X was ...
Further analysis showed that ...
Further statistical tests revealed ...
A two-way ANOVA revealed that ...
On average, Xs were shown to have ...
Strong evidence of X was found when ...
This result is significant at the p = 0.05 level.
The results, as shown in Table 1, indicate that ...
A positive correlation was found between X and Y.
There was a significant positive correlation between ...
The difference between the X and Y groups was significant.

Stating a negative result - close

No increase in X was detected.
No difference greater than X was observed.
No significant differences were found between ...
None of these differences were statistically significant.
No significant difference between the two groups was evident.
No significant reduction in X was found compared with placebo.
No evidence was found for non-linear associations between X and Y.
No significant correlation was found between X scores and the Y scores (p = .274)

X appeared to be unaffected by Y.
Only trace amounts of X were detected in ...
There was no evidence that X has an influence on ...
The Chi-square test did not show any significant differences between ...
Overall, X did not affect males and females differently in these measures.
A clear benefit of X in the prevention of Y could not be identified in this analysis.
T-tests found no significant differences in mean scores on the X and Y subscales.

phrasebank.manchester.ac.uk
Results Structure

1. Whether to separate results and discussion?
2. How to structure the results?

Organizing principle:
The results chapter (as well as the discussion chapter) can be organized on the basis of the research questions (White, 2011).
Tables and Figures
Your thesis is NOT an information dump

- It is important that only data which helps to answer the research question(s) is presented...

How, though, to order the subheadings? Both empirical and qualitative studies generally produce a far greater body of analysed data than will appear in the final draft of the results section or sub-sections. It is often difficult, therefore, when initially confronting the data to know where to start and easy to succumb to the temptation of trying to include as much as possible. The consequence of doing so in both qualitative and empirical theses is loss of direction. This is usually indicated in the latter by a long and confused sequence of tables and figures. What is needed, therefore, is sufficient data to provide coherence to the description provided but not so much as to disturb its clarity. Both to achieve this balance and to provide logic to the manner in which the data are ordered, a clear idea of the narrative to be presented should be developed. Only in this way will the examiners know where they are being led.

(White, 2011, p. 273)
E-book avail at Lib.
Figures should speak for themselves

- Typically used to illustrate objects, scenarios, theoretical models etc or to report measurements (as in the example below)

*(Gibson, 2015, p. 304)*
Either before or after the figure, there is typically a brief explanation, highlighting (and / or explaining) the most relevant finding

_Actigraphy data._

There were seven complete days of actigraphy data available from Andrew at both Times 1 and 2 (Appendix 21, _Figure A.16_). The sleep propensity curves using these data show a reduction in daytime sleep at Time 2, he was also going to bed slightly later and getting up slightly earlier compared to Time 1 (Figure 5.36).

(Gibson, 2015, p. 303 – 304)
Tables are used to provide a detailed summary of results

(Gibson, 2015, p. 303)
These are typically followed by a paragraph which highlights the points of interest and provides some explanations.

At Time 2 Andrew still rated his sleep as “fairly good”. His PSQI and SDI scores remained within the normal range, however decreased in severity since Time 1. This was due to him having some trouble getting to sleep … . There was some improvement in the frequency of his memory-related symptoms at Time 2 …
It is important that the text comments on, rather than repeats information presented visually.

There was no significant difference in the SnNR between day and night for passerine birds except one call example of saddleback (sad1; Table 3.5). At night, SnNR was higher compared to the day for most of the other bird sounds (Fig. 3.4). It is evident from these results that the sound transmission of nocturnal birds was significantly better during the night compared to the day. Bittern and kakapo booms consistently followed the opposite pattern (their SnNR was significantly higher during the day).

Priyadarshani, 2017, p. 65
Theses based on quantitative data typically include numerous tables and figures like the ones shown above in the results section(s)

You’ll need to learn how to format these (e.g. using MS Word etc), so that you can automatically generate lists of tables and figures
Examples of lists of figures and tables

LIST OF FIGURES

Figure 2.1 Schematic representations of mechanical devices used to produce emulsions: (a) high pressure valve homogeniser, (b) microfluidiser and (c) ultrasonic probe homogeniser. ........................................................................................................ 15

Figure 2.2 Schematic illustration of movement of organic solvent in oil droplets during preparation of nanoemulsions using emulsification and solvent displacement-evaporation. The aqueous phase contains water and emulsifiers. ............................................................................ 20

Figure 2.3 Examples of TEM images of β-carotene nanodispersions using (a) resin embedding and (b) freeze-fracture replica methods. ................................................................. 25

Figure 2.4 Schematic representations of the thickness of interfacial layer (δ) on the droplet radii (r) in (a) conventional emulsion and (b) nanoemulsion. .......................................... 26

Figure 2.5 Schematic illustrations of spray dryer and freeze dryer (showing the major components). ...................................................................................................................... 33

Figure 2.6 Schematic illustrations of airflow movement in spray dryers: (a) co-current, (b) counter current and (c) mixed flow patterns. ................................................................. 34

Figure 2.7 Chemical structures of (a) lutein and (b) lutein esters. ................................................................. 40

Figure 2.8 Schematic representations of emulsion structures that may be formed in emulsions containing two different biopolymers denoted as “A” and “B”: (a) single layer, (b) bilayer and (c) mixed layer. ......................................................................................... 44

Figure 2.9 Schematic illustrations of cell absorption by (a) paracellular and (b) transcellular mechanisms. ........................................................................................................... 48

Figure 3.1 Schematic illustration of a combined method of high pressure homogenisation and solvent evaporation used to produce nanoemulsions. ................................. 53

Figure 3.2 Pictures of (a) laboratory scale microfluidiser (M-110P) and (b) rotary evaporator. ................................................................. 55

Figure 3.3 Pictures of (a) Zetasizer Nano ZS and (b) Mastersizer 2000 equipped with the Hydro 2000MU. ......................................................................................... 56

Figure 3.4 Picture of a transmission electron microscope. ............................................................................. 58

Figure 4.1 Particle size distributions of WPI-stabilised nanoemulsion during preparation. A coarse emulsion was formed by mixing the aqueous phase and organic phase using high shear mixer. The coarse emulsion was homogenised using a microfluidiser at 80 MPa for 4 cycles and evaporated using a rotary evaporator (50°C; 153 mBar) to remove ethyl acetate. ......................................................... 65

LIST OF TABLES

Table 2.1 Physicochemical properties of caseins and whey proteins in bovine milk. ................................................................. 11

Table 2.2 Properties and uses of selected organic solvents used in preparation of nanoemulsions. ......................................................................................................... 21

Table 2.3 Summary of some wall materials used in microencapsulation by drying methods in foods. .................................................................................................................. 38

Table 2.4 Physicochemical properties of lutein. ................................................................................................. 41

Table 2.5 Summary of physiological conditions and some possible physicochemical processes when emulsions pass through the GI tract during digestion. ......................... 48

Table 4.1 Composition of conventional emulsion and nanoemulsion prepared at organic phase ratio of 10:90. ......................................................................................... 61

Table 4.2 Variations of the emulsion composition and conditions used in the preparation of nanoemulsions. ........................................................................................................ 62

Table 4.3 Mean particle diameter (Z-Average) and PDI of coarse emulsion and nanoemulsion before and after evaporation. ........................................................................... 65

Table 4.4 Mean particle diameter (Z-Average) and mean ζ-potential of conventional emulsion and nanoemulsion. ......................................................................................... 67

Table 4.5 Physicochemical properties of different types of oil used to prepare nanoemulsions and the characteristics of emulsions formed. .................................................. 76

Table 5.1 Formulations with different wall materials and their theoretical fat content in powders assuming removal of all moisture via evaporation during spray drying. 96

Table 5.2 Mean moisture content and water activity of spray dried powders prepared with different wall materials containing 10, 20 or 30% (w/w) in feed solutions. .................. 107

Table 5.3 Particle size and bulk density of spray dried powders prepared with different wall materials containing 10, 20 or 30% (w/w). ......................................................... 108

Table 5.4 Total, surface oil content and encapsulation efficiency of powders prepared with different wall materials containing 10, 20 and 30% (w/w) dry matter. ................. 117

Table 5.5 Water activity and dispersibility of spray dried powders prepared with different wall materials containing 10, 20 and 30% (w/w) dry matter. .................................. 118

Table 5.6 Brix readings of nanoemulsions with wall solutions before and after spray drying process and the amount of powders added for reconstitution. ............................ 119

Table 5.7 Mean particle size (Z-Average) and ζ-potential of initial nanoemulsions and nanoemulsions after reconstitution prepared with different wall materials at pH 7. .... 120

Table 5.8 Properties of spray dried and freeze dried nanoemulsion powders containing 20% (w/w) trehalose. 123
It is also common to include lists of technical terms, symbols, abbreviations, etc – so this is something to build up as you go along.

**LIST OF SYMBOLS**

- C: Mass sensitivity constant
- D: Translational diffusion coefficient
- $D_{3,2}$: Surface weighted mean
- $D_{4,3}$: Volume weighted mean
- f(xa): Henry’s function
- g: Gravitational acceleration
- h: Thickness
- K: Boltzmann’s constant
- k: Rate constant
- n: Overtone number
- r: Radius
- T: Temperature
- $U_2$: Electrophoretic mobility
- v: Creaming velocity

**LIST OF ABBREVIATIONS**

- AMD: Age-related macular degeneration
- AMY: Amylase
- ANOVA: Analysis of Variance
- APS: Ammonium persulphate
- BHT: Butylated hydroxytoluene
- CaCl$_2$: Calcium chloride
- CC: Coconut oil
- CCP: Colloidal calcium phosphate
- CIE: Commission Internationale de L’Eclairage
- CR: Corn oil
- DE: Dextrose Equivalence
- DLS: Dynamic Light Scattering
- DMEM: Dulbecco’s modified eagle medium
- DMSO: Dimethyl sulfoxide
- EE: Encapsulation efficiency
Results style
Although the emulsions were physically stable during storage, it was observed that the colour of all the emulsions faded slightly over time and became lighter especially at higher temperature of 40°C (Figure 8.4). Initially, the emulsions were orange in colour as lutein is a colour pigment with an intense yellow-orange (depending on the concentration) but the colour intensity of emulsions became lighter due to chemical degradation of lutein. Indeed, the L value of emulsions increased while the colour parameters were found to decrease during storage at higher temperatures (Table 8.3). The L value measures lightness and an increase in L value indicates colour fading of emulsions during storage (Qian, Decker, Xiao & McClements, 2012). A decrease in positive a value indicates a decrease in the redness of the emulsions while a decrease in positive b value indicates a decrease in the yellowness (Qian et al., 2012). Therefore, the colour measurements indicate some loss or change of colour in the emulsions during storage, also indicating the degradation of lutein.

Teo, 2016, p. 198
Table 5.3 summarises the performance of each detector on natural noisy field recordings using the threshold given in the previous section. This table reflects a single point of each ROC curve in Fig. 5.7 which matches the selected threshold. The wavelet filtering algorithm achieved more than 95% recall in detecting close-range calls (‘very loud’ and ‘loud’). Even when the calls were very faded the recall was just below 70%. The detector was successful in detecting 30% of extremely faded calls. In the case of bittern and k¯ak¯ap¯o booming calls we had to revisit the human ground truth labels after using our algorithm: a few extra calls were found by our algorithm, and after retrospective consideration, included to the annotation.

Priyadarshani, 2017, p. 141
We evaluate / evaluated our method with the common energy based thresholding (Jinnai et al., 2012) and median clipping (Lasseck, 2013, 2015b). Table 5.5 summarises / summarised our findings on the same dataset as presented in the previous section (Table 5.3 and Table 5.4). We count / counted the number of seconds of target sounds detected instead of number of bird calls. As we mention / mentioned before, this is not a perfect comparison, because the reference methods are detecting any sound, while the wavelet filter only detects / detected target bird sounds. The overall recall of the proposed segmentation by wavelet filtering method (78%) is / was better than time domain energy thresholding (47%) and spectrogram-based median clipping (30%). Another method that could be used would be spectrogram cross-correlation (Cortopassi and Bradbury, 2000). However, this requires / required the manual selection of a large number of individual calls to act as templates, and degrades / degraded quickly with noise, and we therefore choose / chose not to use it here.

Priyadarshani, 2017, p. 141
We evaluated our method with the common energy based thresholding (Jinnai et al., 2012) and median clipping (Lasseck, 2013, 2015b). Table 5.5 summarises our findings on the same dataset as presented in the previous section (Table 5.3 and Table 5.4). We counted the number of seconds of target sounds detected instead of number of bird calls. As we mentioned before, this is not a perfect comparison, because the reference methods are detecting any sound, while the wavelet filter only detects target bird sounds. The overall recall of the proposed segmentation by wavelet filtering method (78%) was better than time domain energy thresholding (47%) and spectrogram-based median clipping (30%). Another method that could be used would be spectrogram cross-correlation (Cortopassi and Bradbury, 2000). However, this requires the manual selection of a large number of individual calls to act as templates, and degrades quickly with noise, and we therefore chose not to use it here.
Discussion style
Previous research has demonstrated that …..

The aim of this thesis was to build on these previous findings and further examine … Specific objectives were to examine … in order to determine …

Briefly, chapter 3 investigated … Chapters 4 and 5 compared. Chapter 6 examined …

The following sections will focus on the general outcomes, results, conclusions and implications of the experiments of this thesis. Identified limitations and weaknesses of the research will also be discussed, followed by recommendations for future research. Finally, the main conclusions of this research will be summarised.
Previous research (citation) ... indicates ... The results of Study 2 are similar. However, .... Furthermore, ....

Despite the fact that ... (citation), older participants in Studies 1 and 2 were less likely to report ... This pattern has been noted in previous studies. The findings presented in Study 3 and elsewhere (citation) help to further explain this pattern.

Unlike the previous studies of younger New Zealanders (citation), Study 1 found ... This may be due to ... Sleep health might be better predicted by .... Future research incorporating ... would help to clarify these findings.
The sample of carers in Study 4 had _______ good sleep compared to some other groups of dementia carers ... _______, carers in (citation) had an average sleep efficiency of 88%, _______ those in Study 4 had an average of 88%. _______, on the PSQI, 66% of Study 4 carers reported symptoms of sleep disturbance at Time 1. _______ PSQI findings from previous studies with dementia carers (citations) and _______ greater sleep disturbances than among non-carers. _______ between subjective and objective sleep data have also been found in other samples of older carers (citations) and _______ the psychosocial impact of caring on the symptoms of insomnia.

Gibson, 2015, p. 330 - 331
Discussing findings

Providing background information: reference to the literature

Providing background information: reference to the question

Restating the result or one of several results

Indicating an unexpected outcome

Comparing the result: supporting previous findings

Comparing the result: contradicting previous findings

Offering an explanation for the findings

Comparing the result: contradicting previous findings - close

This study has been unable to demonstrate that ...
However, this result has not previously been described.
This outcome is contrary to that of Smith et al. (2001) who found ...
This finding is contrary to previous studies which have suggested that ...
In contrast to earlier findings, however, no evidence of X was detected.
The yields in this investigation were higher compared to those of other studies.
However, the findings of the current study do not support the previous research.
Smith et al. (1999) showed that ... This differs from the findings presented here ...
The overall level was found to be 15%, lower than that of previously reported levels.
It has been suggested that ... (Smith et al., 2002). This does not appear to be the case.
The levels observed in this investigation are far below those observed by Smith et al. (2007).
These results differ from X’s 2003 estimate of Y, but they are broadly consistent with earlier ...

In regards to the link above, will I have to capitalize the organization name as HELP, or would it be Just Help?

It looks like you are using APA style. For APA style, the general rule is that an organisation’s name should have the first letter capitalised. See http://blog.apastyle.org/apastyle/2012/02/do-i-capitalize-this-word.html

So, although they use all capital letters for the whole word, in the reference list I’d write it as follows:
